## ME/MT-100 CARBURETOR NEEDLE

In the 20 mm carburetor, the standard needle (#4DG6), is 49 mm long (15/16). The clip is normally in the third notch from the top, but if the tuning, or "use", condition requires the clip to be moved to the first or second notch from the top, the end of the needle will bottom out against the main jet.

To eliminate this condition, please order a new needle, No. 4DG6• (Indian Part No. 92001192), or cut 3 mm off the tip of the original needle. The new needle (#4DG6•) is 46 mm long (27/32). The new needle can be set in any of the five notches.

The mid-position is the normal position. The top notches are "leaner", and the bottom notches are "richer".
