

3) To calculate the quantity of oil needed for a 10:1 compression ratio in this particular fork leg, first multiply the quantity of fluid the fully-compressed leg holds by the compression ratio. Next, subtract the quantity of fluid the fully-extended leg holds and then divide this number by the compression ratio number minus one. The result is the quantity of oil the fork leg needs for a given compression ratio. In this case, 250cc of fork oil are needed for a 10:1 compression ratio.

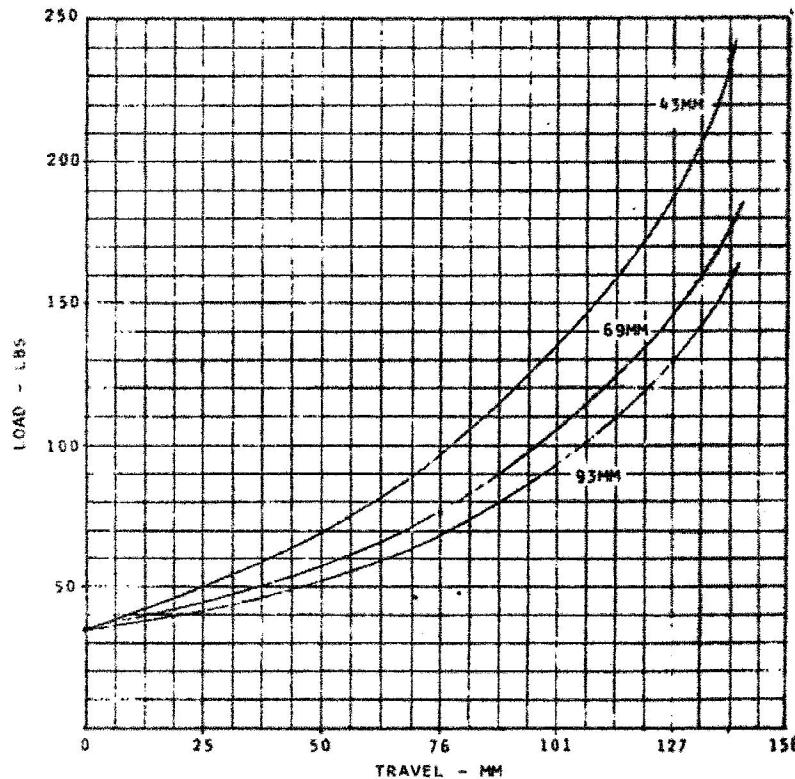

$$275 \times 10 = 2750$$

$$2750 - 500 = 2250$$

$$10 - 1 = 9$$

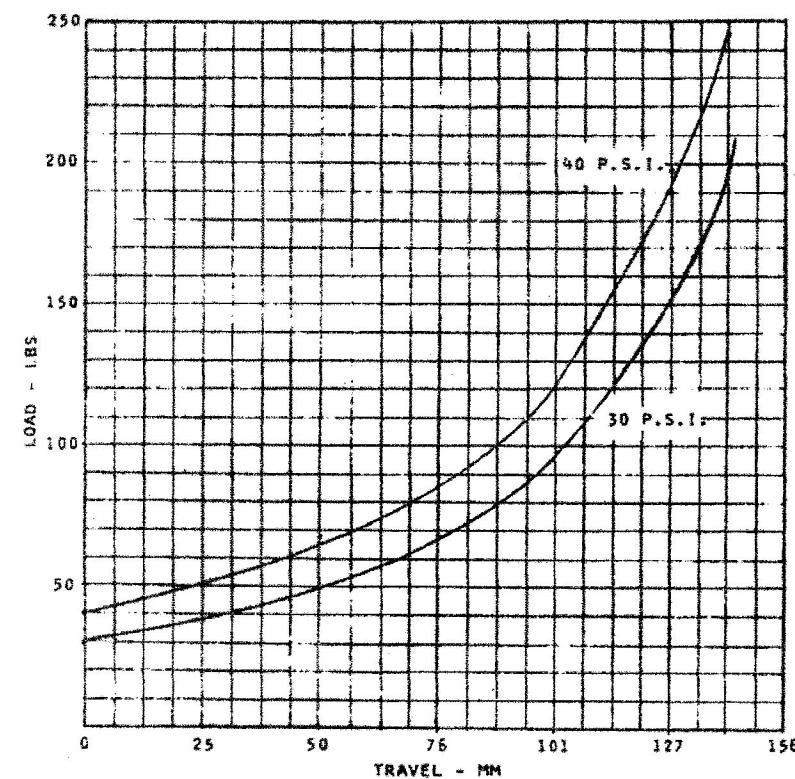

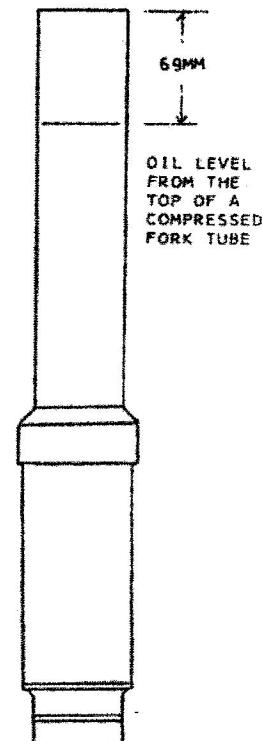

$$2250 \div 9 = 250\text{cc of oil}$$
